KEY TO SYMBOLS

Red symbols indicate internal characteristics.
 Green symbols indicate external characteristics.

The laboratory grown diamond described in this Report ("Report") has been graded, tested, analyzed, examined and/or inscribed by International Gemological Institute (IGI). A laboratory grown diamond is one that has, essentially, the same chemical, physical and optical properties as a mined diamond, with the exception of being grown by man (or machine) rather than by nature. IGI's laboratory grown diamonds are produced using either chemical vapor deposition (CVD) or High Pressure High Temperature (HPHT) growth processes and may include post-growth treatments to alter the color. IGI employs and utilizes those techniques and equipment currently available to IGI, including, without limitation, 10X magnification, corrected triplet loupe, binocular microscope, master color comparison stones, non-contact optical measuring device, Spectrophotometer and such other instruments and/or processes as deemed appropriate by IGI. In the case where diamond inclusions are seen in a laboratory grown diamond, the inclusions are not the same as those found in a naturally occurring diamond. A duly accredited gemologist or jeweler can advise you with respect to the importance of and interrelationship between cut, color, clarity and carat weight.
